ITEC 204 – Data Structures and Algorithms

Name: Garlit, Justinne Lorraine L.	Date: September 9, 2026
Section: BSIT2A	Instructor:

- I. **Objective:** Write a short explanation of what your program is designed to do. (Minimum of 3 sentences)

This program helps the IT support team keep track of problems, called incident tickets, that come from automation bots. The user can add a new ticket, see all the tickets, find a ticket using its Incident ID, remove a ticket that is already fixed, and count how many tickets are left. All the tickets are saved in a Python list, which keeps them in order, one after another.

- II. **Program Operations:** Briefly explain how your program performs each operation. (Insert Specific Code Line and Your Explanation)

Explanation: The user types the Incident ID, Bot, and Short Description. The program puts them together as one ticket and adds it to the end of the list using append().

```
tickets.append({"id": inc_id, "bot": bot, "desc": desc})
```

Explanation: The program goes through the list one ticket at a time and prints each one. If there are no tickets, it says "No active tickets."

```
for ticket in tickets:  
    print(ticket["id"], "|", ticket["bot"], "|", ticket["desc"])
```

Explanation: The user types an Incident ID. The program checks each ticket one by one. If it finds a match, it shows the ticket. If not, it says "Ticket not found."

```
for ticket in tickets:  
    if ticket["id"] == inc_id:  
        print("Ticket found!")
```

Explanation: The user types the Incident ID of a fixed ticket. The program finds it and deletes it from the list using remove(). If the ID is not in the list, it says "Ticket not found."

```
for ticket in tickets:  
    if ticket["id"] == inc_id:  
        tickets.remove(ticket)
```

College of Computer Studies

Explanation: The program uses len() to count how many tickets are in the list and shows the total.

print("Total active tickets:", len(tickets))

III. **Flowchart:** Create a flowchart showing the overall process and logic of your program.

Flowchart: IT Automation Incident Ticket Manager

IV. **Conclusion:** Briefly explain what you learned from the activity and how the linear data structure was applied.

In this activity, I learned how to use a list to store and manage data. Each ticket was saved in the list, one after another. I used append() to add a ticket, a for loop to show and find tickets, remove() to delete a fixed ticket, and len() to count them. I also learned that to find something in a list, the program checks each item one by one. This activity showed me how a list makes it easy to organize records in a program.
